

We are implementing two main features in the sprint. The first feature is events. Each event can be created by an Admin and then viewed by a student. This feature is separated from the rest of the app, so it was able to be easily and successfully implemented without any issues. The other feature is job postings and that's more complex. The critical path is the path going from 'Employer create job postings' to 'Employer view job applications'. This was mostly finished, as the student profile was incomplete, and there were some other bugs specifically in managing job postings as an employer. We learned to plan our work out earlier and to make sure all back-end work is done early so that they can be identified and fixed with a more realistic timeline.
